Ability to Auto Cycle and Strobe/breathe at the same time:

- Press button [2] 1 to 3 times to select auto cycle speed
- Then Press button [3] 1 to 3 times to select strobe/breathe

Installation Instructions - Page 2

Installation Tips

- Follow the diagram below for wiring the LED's to the harness. Note there are 2 red wires, the wire with the Fuse goes to the battery.
- Disconnect the Negative [] battery cable from the battery before beginning wiring.
- Pick a location to run all of the wires from the LED's and make your connections. The most common location is under the seat so to have close access to the battery.
- Decide which LED's will be on which zone, then group the wires by zone 1, 2 or 3.
- For a clean, reliable install, use terminal blocks or Cage Clamps® to group your wires and to join to the remote harness.
- Install the Black box receiver in an area under the seat that will not get crushed or damaged.
- 7. Test function of the remote before riding.
- 8. If system will not turn on, check the inline fuse on the red wire.
- If system will not turn on, verify that the blue light on the key fob is coming on. If it is not, or blue light is dim or is flickering, batteries are weak. Replace with fresh batteries and try again.

Make sure the bike is cool and parked on a flat surface. Always follow proper safety procedures.

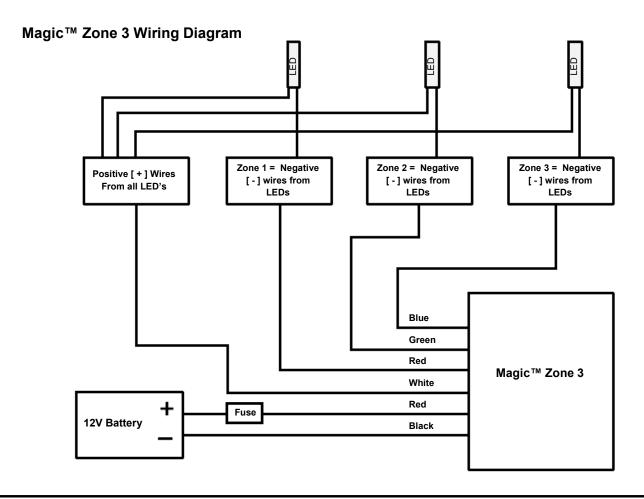

Negative [-] battery cable must be disconnected before installation begins to avoid potential fire hazard.

This guide assumes user has properly installed the LED lighting products that are to be used in conjunction with this product. Custom Dynamics is not responsible for procedures and instructions for installing LED products from other manufacturers.

Never use a fuse size greater than 5 amps, using larger fuse is an alteration to the unit and will void warranty.
